

*Know your risk of breast cancer recurrence with **CanAssist Breast***

*What is **CanAssist Breast**?*

CanAssist Breast (CAB) is a prognostic test for eligible* early breast cancer patients. CAB is performed on patient's tumor sample removed during surgery and provides information about risk of breast cancer recurrence beyond what current conventional methods can offer. CAB determines whether a patient has **"low - or high-risk"** of breast cancer recurrence, which helps oncologists in deciding use of chemotherapy and/or additional therapies.

CanAssist Breast is offered as a service from OncoStem's CAP and ISO 13485 accredited laboratory in Bangalore, India.

CanAssist Breast Offered as a Service:-

What makes CAB unique?

First test to be developed and validated on Asian patients

Large Indian and international validation cohort

Machine Learning-based algorithm

Renowned validation partners in India, USA and Europe

5 year prospective Real world use of CAB shows accuracy of 98%

Patented combination of biomarkers

CAP accredited
ISO 13485
accredited

Published & presented in major international journals & conferences
