Know your risk of breast cancer recurrence with *CanAssist Breast*

What is *CanAssist Breast?*

CanAssist Breast (CAB) is a prognostic test developed by OncoStem for eligible* breast cancer patients. CAB is performed on patient's tumor sample removed during surgery and provides information about risk of breast cancer recurrence beyond what current conventional methods can offer. CAB determines whether a patient has "low- or high-risk" of breast cancer recurrence, which helps oncologists in deciding use of chemotherapy and/or additional therapies.

CanAssist Breast is offered as a service from OncoStem's CAP, ISO15189 and ISO13485 accredited laboratory in Bangalore, India.

CanAssist Breast Offered as a Service:-

| Eligible breast cancer patients | → | Paraffin block of tumor removed by surgery | → | Sent to OncoStem Diagnostics | → | OncoStem to perform CAB test | → | CAB report is sent to doctors and patients within 8 Working Days |

What makes CAB unique?

First test to be developed and validated on Asian patients

Large Indian and international validation cohort

Machine Learning-based algorithm

Renowned validation partners in India, USA and Europe

Patented combination of biomarkers

CAP accredited
ISO 13485 accredited
ISO 15189 accredited

Published & presented in major international journals & conferences

CanAssist Breast's Machine Learning algorithm answers key questions any breast cancer patient may have.

Will my breast cancer recur in my body?

Do I need chemotherapy?

Can I avoid chemotherapy?
